

Every time you switch AI tools, your context disappears.

Cursor planned it. Claude Code built it.

Codex is reviewing it.

Every new session starts completely blind.

Decisions forgotten. Work redone.

There's a fix →

Meet taskbaton

A CLI that carries work state between agentic tool sessions.

Any agent reads `.baton/current.md` and picks up exactly where the last left off.

Human is the checkpoint at every seal — agent drafts, human confirms, baton passes.

What every agent reads at session start

```
# Baton – feature/auth
```

```
Stage:   feature/auth
```

```
Status:  sealed
```

```
From:    claude-code → Next: cursor
```

Decisions

- RS256 not HS256 – security team requirement
- Token expiry 15min/7d – no PM sign-off to change

Next Tasks

- Implement RBAC on top of existing auth
- Start at src/middleware/rbac.go

Constraints – Do Not Change

- src/middleware/auth.go – sealed by security review

Decisions with reasons. Constraints with context.

Nothing survives the handover without a why.

Free-tier usage hit 100%? You're covered.

`taskbaton checkpoint` saves your state mid-session.
Switch to another tool — pick up from a draft, not a blank page.

```
$ taskbaton checkpoint
```

```
✓ checkpoint saved at 22:14 • stage: feature/auth • open  
47 min
```

```
run taskbaton review to add notes • seal to finalize
```

Works with any AI tool — Cursor · Claude Code · Codex · Gemini CLI

Agents read baton state natively.

No copy-paste.

`taskbaton mcp` starts a Model Context Protocol server.

Register once — every agent reads stage, decisions, next tasks & constraints as native context.

```
{
  "mcpServers": {
    "taskbaton": {
      "command": "taskbaton",
      "args": ["mcp"]
    }
  }
}
```

`baton://current`

`baton://current.json`

`baton://history`

Try it on your next project.

```
$ brew tap ssthil/senthil-tools
```

```
$ brew install taskbaton
```

```
# or: go install github.com/ssthil/taskbaton@latest
```
